

SECURE LOGON

Software + Service from visionapp

visionapp Secure Logon

Secure access to company data – anytime, anywhere

visionapp Secure Logon delivers security for your web-based resources and ease of use for your employees. Because any terminal with a browser and Internet connection can be used to securely logon, visionapp Secure Logon is perfect as an alternative to traditional VPNs or as an enhancement to Citrix Secure Gateway, Citrix Access Gateway, and other remote access solutions.

Flexible, secure access is a must for business

Today, companies need their IT infrastructures to be more flexible than ever. Employees must work in any office, from home or on the road, and on non-company devices, like their home PCs, hotel PCs, or airport kiosks. Security is an issue as well: with service providers, contractors, and other outsourced workers coming and going, companies must be sure that their resources stay safe.

With IT requirements changing daily with the user populations because of the speed of business, it's crucial for IT departments to provide capacity expansion, high performance, ease of use, and anywhere access to company resources.

Easy for users to log in

visionapp Secure Logon enables fast and secure logon to a company network. There is no client software to install, because visionapp Secure

Logon is completely server-based. On the administration side, visionapp Secure Logon is easy to maintain, with a significantly lower average cost for user support compared to other remote access solutions.

Strengthen authentication into your network

visionapp Secure Logon supports several logon methods:

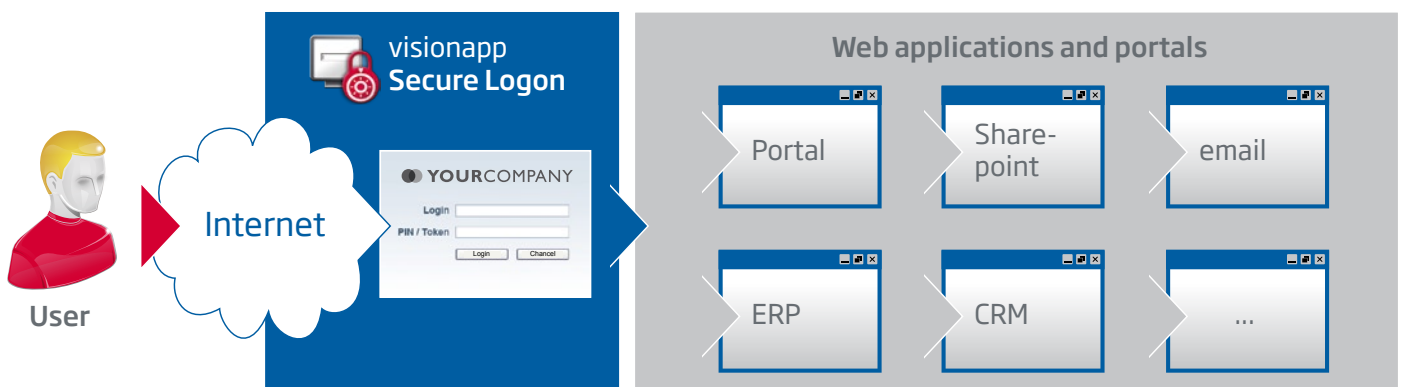

- > Username / password
- > Certificates
- > Smart cards
- > Mobile phones (SMS)
- > One-time password
- > RADIUS-based systems

A free, integrated software-based one-time password solution can be used for strong authentication. This challenge response software solution can be used on windows or other computers (running Java) and mobile devices (running Java ME, Windows Mobile or Android).

Advantages

- > **High level of security: username and passwords remain within the company network**
- > **Powerful access control: End Point Analysis enables access in accordance with granular authorization rules**
- > **No user footprint: no need for hardware or software for users' devices**
- > **User experience: easy to log on**
- > **High flexibility: connect your users in their home offices, hotel rooms, branch offices, and partner organizations**

With SMS (Short Message Service) authentication, a password can also be transmitted direct via SMS to a mobile phone. This two-way authentication is a highly secure, easy way for users to access resources.

Optimum access control

visionapp Secure Logon's integrated End Point Analysis checks the user's device for specific security criteria, such as certificates, registry values, services currently running, or MAC address. You can intelligently combine different checks for granular secure access to company resources.

Convenient, secure access through single sign-on

visionapp Secure Logon also allows for single sign-on to all your company resources. Because a user can enter the same username and password to access to many services, a user's single password—presented at a URL of your choosing—can provide access to all trusted applications during their sessions.

The single sign-on solution supports the conversion of personal logon information to internal domain logon data, so usernames and passwords are treated securely.

No installation on user devices

No software or hardware is installed locally – visionapp Secure Logon is a completely server-based solution.

visionapp Secure Logon is easy to maintain, even for large numbers of users, resulting in substantial reductions in user support costs compared to other solutions.

Enable your business for flexible, remote access

visionapp Secure Logon enables fast, secure logging on of employees to the company network, allowing your IT department to offer:

- > Access from a home office or use of home PCs as a workplace.
- > Flexible extension of business operations with new branch offices – without the creation of a complex infrastructure.
- > Easy linking of IT divisions of different companies.
- > Secure outsourcing of projects.
- > Integration of customers and suppliers into existing business processes.

Support of Citrix and Microsoft Terminal Services

visionapp Secure Logon supports standard Citrix and Microsoft technologies, ensuring central availability of desktop applications such as Microsoft Office. Using visionapp Secure Logon with a Citrix Secure Gateway, Citrix Access Gateway, or Microsoft Terminal Services Gateway, conventional desktop programs can be used anywhere – securely from any device.

» With the aid of visionapp products we were able to optimally meet our requirements for secure and flexible access to both applications and data. «
