

## **Improved authentication and more flexible access management**

### **visionapp integrates challenge response authentication and extends RADIUS support**

***Eschborn/Ettlingen, September 18, 2008/LG:* For the end of October 2008 visionapp AG will publish Release 2 (R2) of its visionapp Workspace Management 2008 (vWM) product. An extension for Citrix Web Interface and Microsoft TS Web Access, vWM provides standardized, centrally administered access to applications of all types through a web-based portal. Decisive new features of this latest product version include extended logon and authentication capabilities (RADIUS support and built-in challenge response authentication) and support for Citrix Web Interface 5.0. A Configuration Wizard and the flexible access management further simplify use of the product.**

visionapp Secure Logon (vSL) – a component of vWM 2008 R2 – ensures maximum security logons even through unsecured networks. The new version's unique ability to provide secure logons to systems outside the own domain offers additional security and time savings in large-scale network environments.

"With the integrated challenge response authentication function of the new One Time Pass (vOTP) component of visionapp's vWM 2008 R2, customers no longer need to purchase expensive hardware-based logon solutions", explains Christian Kehl, Product Management Director at visionapp. "And the new direct support for RADIUS [Remote Authentication Dial-In User Service] further enhances access security while at the same time simplifying integration. This is specially valuable in small and medium-sized environments, for which enhanced safety is equally as important as an easy, cost-effective implementation."

"Keeping access management as simple as possible for users and administrators is part of our strategic aim", adds Frank Roth, Managing Director at visionapp. "This is particularly important in more complex installed bases with many different user roles, each of which needs access to different sets of applications. The new version's ability to flexibly group access rights represents a big step towards simplifying access management. This new functionality allows administrators to group access rules and individually tailor application access levels to for each user group flexibly yet quickly and easily.

The new Configuration Wizard provides a quick start for the deployment of key applications, which significantly reduces the initial configuration time. vWM 2008 R2 can therefore be put into operation quickly and without special knowledge after installation.

In addition to German and English, French, Spanish and Czech can now also be selected as interface languages for vWM 2008, and users can add their own languages as required. This further simplifies and speeds up the product's integration in international enterprises' IT infrastructures and provide users with a workspace in their own native language.

"Administrators and users value vWM's adaptable user interface, which allows them to create a personalized workspace without compromising the central control of application and data access. It goes without saying that our products support the latest Citrix technologies, such as Citrix Web Interface 5.0 – a fact that consistently meets with approval from our customers and partners", says Niklas Frangos, Product Marketing Manager at visionapp.
